

# Accessing MongoDB

DF100 - MongoDB Developer Fundamentals

# Topics we cover

---

- The MongoDB Database
- Atlas Managed MongoDB Clusters
- How to Launch an Atlas Cluster
- How to configure Security
- How to Connect to MongoDB with mongosh

# MongoDB Database

---

MongoDB's original product.

A Document model as opposed to a Relational Data model.

- Many things in common with an RDBMS.
- Not JSON - data is stored as binary typed objects.
- Has **container** types - Document and Array.
- Allows for fewer 'tables' and more denormalization options.
- Acknowledges that 3rd normal form isn't optimal in many cases.
- Optimized for Availability, Usability, Scaling, and Speed
- Idiomatic development drivers.

Recap

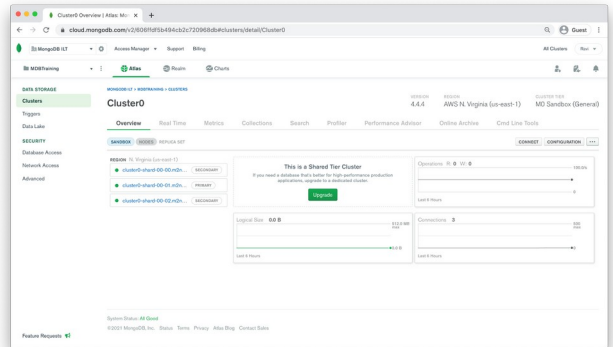

Emphasis on :

- Terminology understanding - Documents / Collections / Databases - Database.Collection = Namespace
- Denormalization is "normal" but 3rd normal form not optimal in many cases

# Atlas Managed MongoDB Clusters

MongoDB Atlas is MongoDB as a Service.

- Highly available, scalable clusters in AWS/GCP/Azure
- Global availability and scaling.
- You can focus on Development and Business.
- Think of it as having a team to run and manage all the Database infrastructure.

Explain about free tier (M0) if they do not already have an account / corporate login  
We are going to configure a 3-node replica set for this training.  
A Node is synonymous to an instance or a single MongoDB server.  
A Cluster is a group of nodes.

# Setting-up MongoDB Atlas

---

We will set up an Atlas Free Tier cluster

- 3 Nodes in different datacenters
- Highly available
- 512 MB of storage
- Secure by default
- Using TLS network encryption

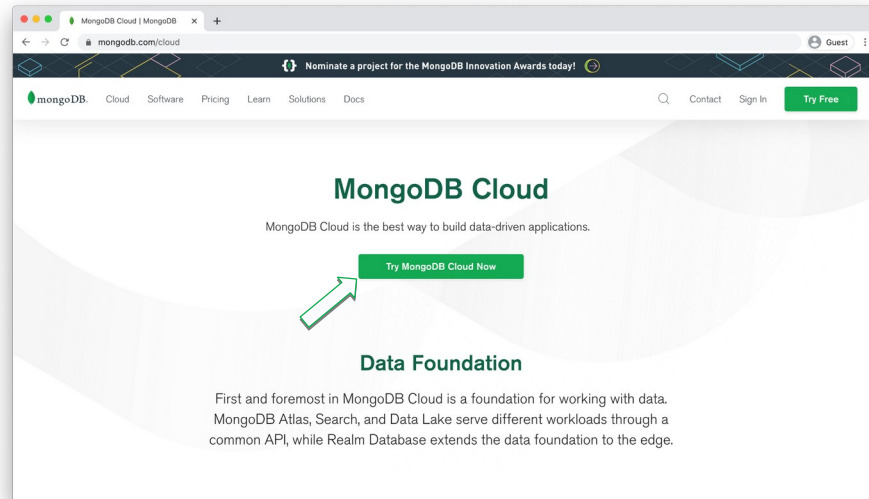

Atlas free tier is on a shared server.

Some functionalities are not available/limited (throughput, number of connections, data transfer limits, monitoring, alerting, API access, etc.)

It is technically large enough to run most small business applications and is free for life.

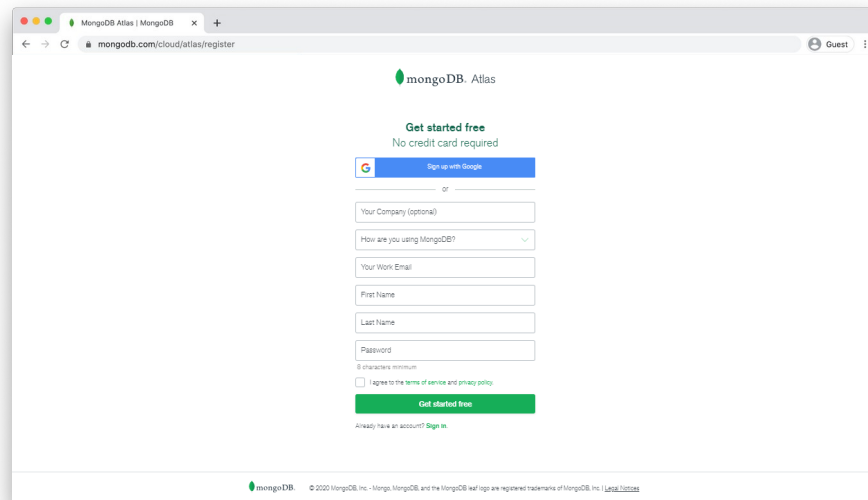

# Go to MongoDB Cloud

Navigate to <https://www.mongodb.com/cloud> in a browser (ideally Chrome).

Click the button **Try MongoDB Cloud Now**.

# Sign up or Sign in

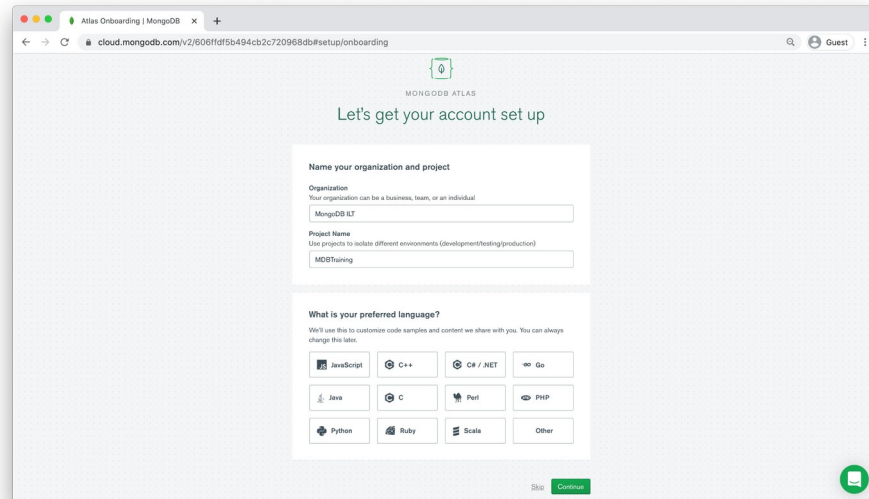

The screenshot shows the MongoDB Atlas registration page in a web browser. The browser's address bar displays 'mongodb.com/cloud/atlas/register'. The page features the MongoDB Atlas logo at the top. Below the logo, the text 'Get started free' and 'No credit card required' is displayed. A 'Sign up with Google' button is prominent, followed by an 'or' separator. Below this, there are input fields for 'Your Company (optional)', a dropdown menu for 'How are you using MongoDB?', 'Your Work Email', 'First Name', 'Last Name', and 'Password'. A checkbox for 'I agree to the terms of service and privacy policy' is located below the password field. A green 'Get started free' button is at the bottom of the form. At the very bottom of the page, there is a link for 'Already have an account? Sign in.' and a footer with copyright information.

Sign up with your name and email

You shouldn't need to confirm email, but you may have to complete a captcha

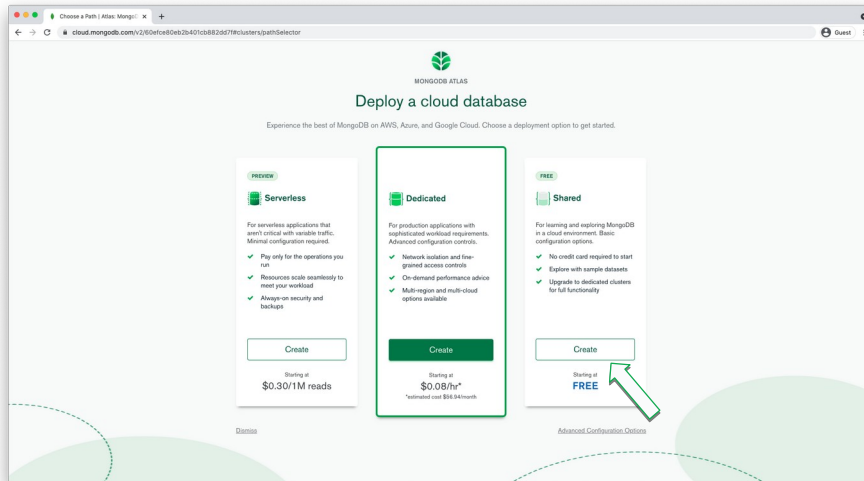

# Organization and Project Setup

The screenshot shows the MongoDB Atlas Onboarding page in a web browser. The browser's address bar displays the URL: `cloud.mongodb.com/v2/606f1df5b494cb2c720968db#setup/onboarding`. The page header includes the MongoDB Atlas logo and the text "Let's get your account set up". The main content area is divided into two sections. The first section, titled "Name your organization and project", contains two input fields. The "Organization" field is labeled "Your organization can be a business, team, or an individual" and contains the text "MongoDB ILT". The "Project Name" field is labeled "Use projects to isolate different environments (development/testing/production)" and contains the text "MDBTraining". The second section, titled "What is your preferred language?", contains a grid of buttons for selecting a programming language. The buttons are: JavaScript, C++, C# / .NET, Go, Java, C, Perl, PHP, Python, Ruby, Scala, and Other. At the bottom right of the form, there are two buttons: "Skip" and "Continue".

# Choose the Free Cluster

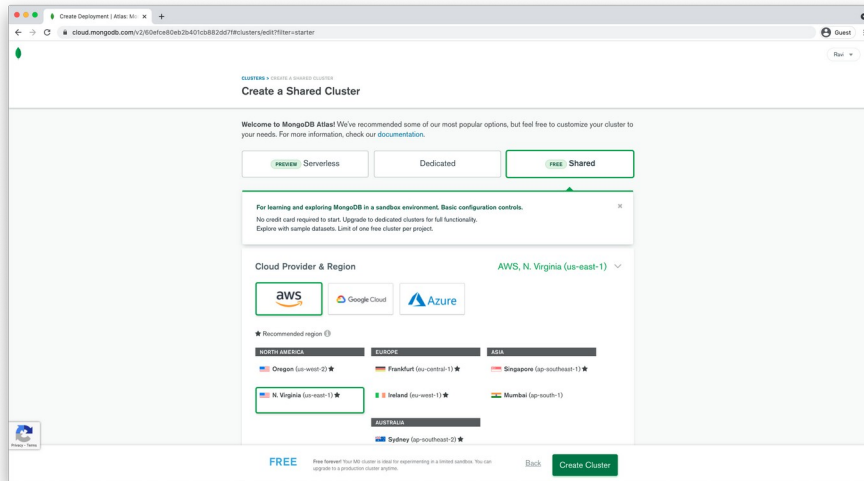

Clusters can be Shared (small), Dedicated (production-ready), or very large indeed and/or distributed globally.

Atlas can go very, very large. You could have a cluster of 50 shards (data partitioned for scaling out) with 768GB of RAM each, 4TB of storage, and 96 CPU's each of which has 7-way replication (350 Massive servers). Of course, this costs \$4200 an hour (approx)

Potential to go larger still if required.

Pick the free one (or similar if you already have an account) - you may not get this screen; if not, click 'Build a New Cluster' to get to the next page.

# Create the Cluster

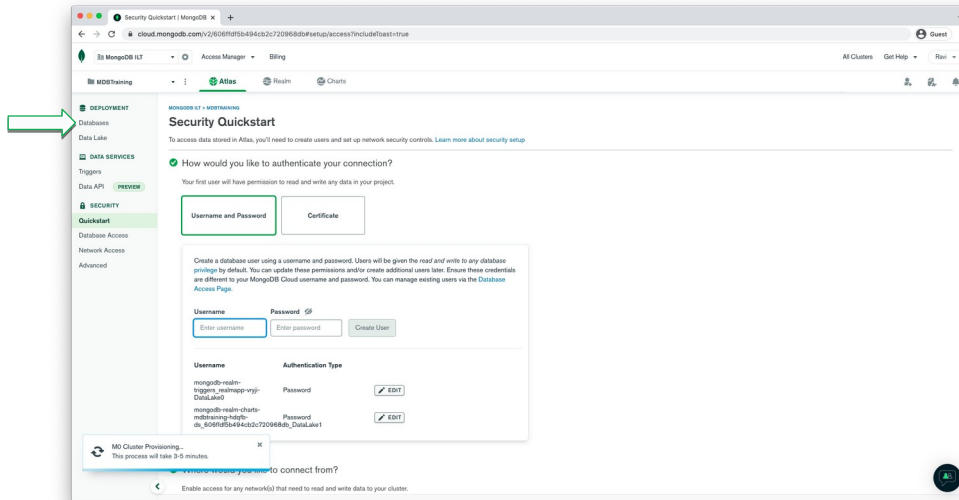

Leave the defaults and click **Create Cluster**

MongoDB 5.0 is supported in M10+ clusters.

M0 doesn't support MongoDB 5.0.

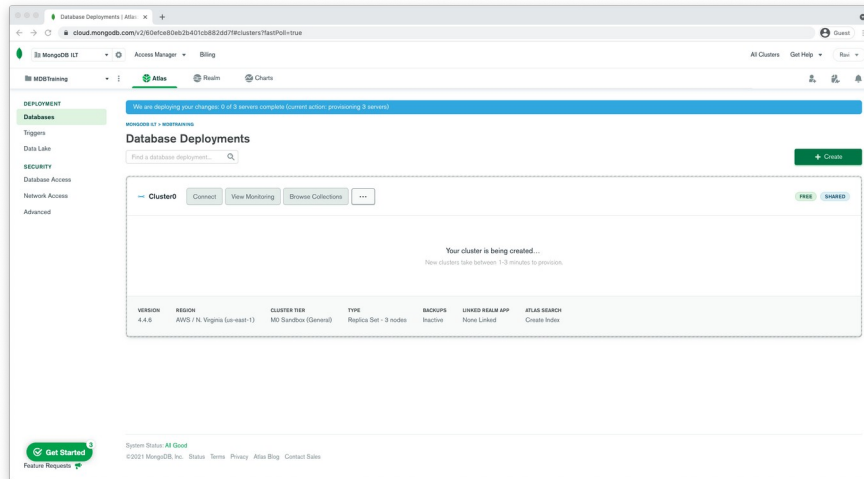

# Skip Quickstart Wizard

If you are redirected to the quickstart wizard, go back to the Databases page as shown above; we would set up users later.

Usually one would go with the quickstart wizard because it is very easy to use and while one adds users the database gets deployed.

# Wait for cluster to start up

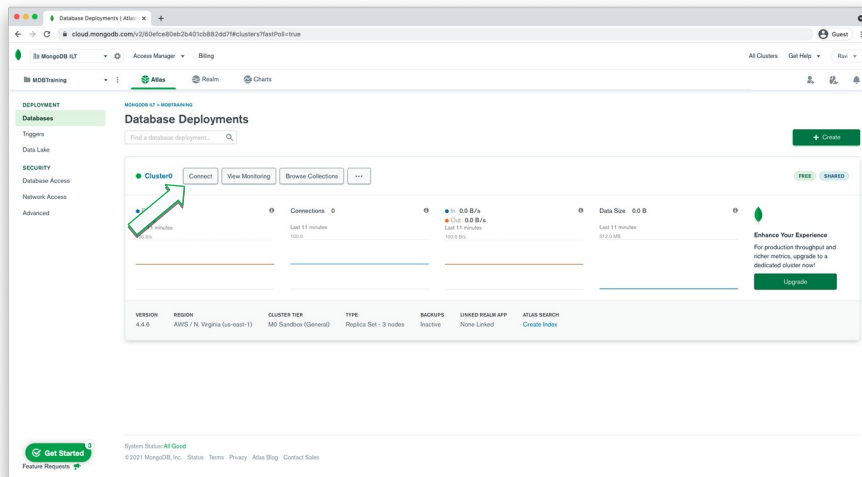

Wait for the cluster to be created (up to 5 mins approx) - Wait for the blue bar at the top to disappear

If you are redirected to the quickstart wizard, go back to the Databases page shown above as we would set up users later.

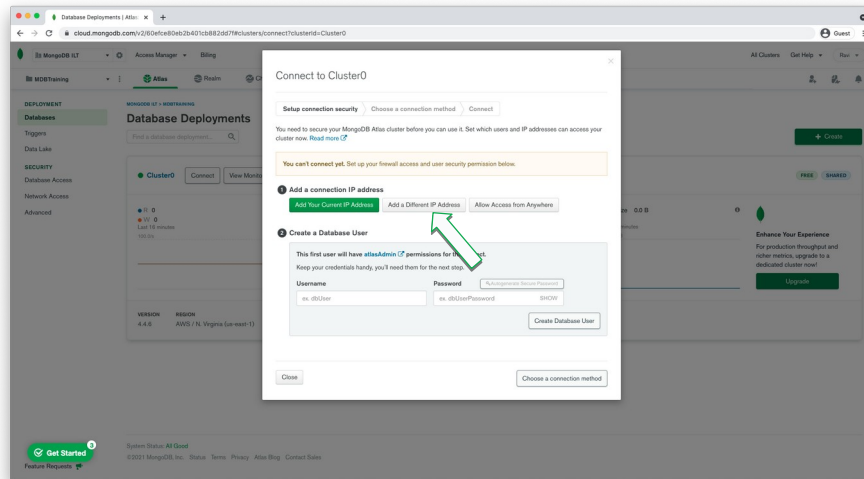

Good time for questions.

# Connect to the cluster

We now have a fully working MongoDB cluster running in three different data centers. Let's connect to it!

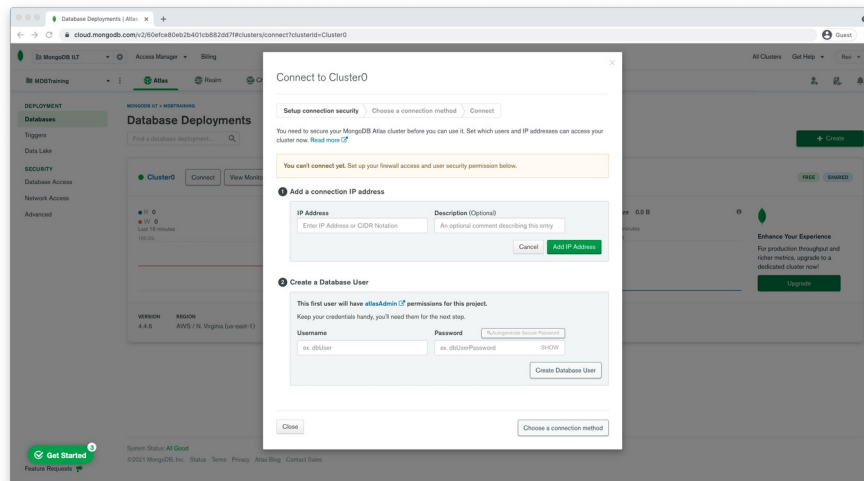

# Setup firewall

Click **Connect**

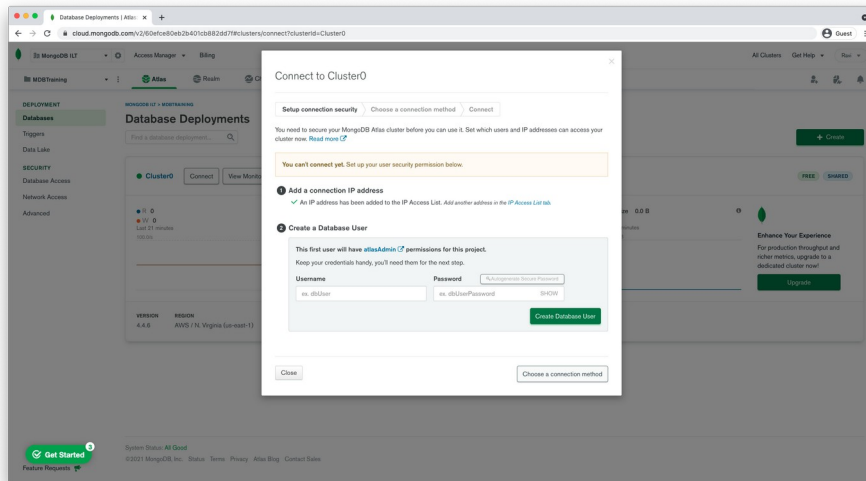

Atlas requires us to specify what hosts can connect to our cluster for security reasons. Ideally, it is good to always select **Add a Different IP Address**.

# Add IP Address

We can add the Strigo public IP here, we can get it by running `curl ifconfig.me` on the Strigo Terminal.

# Add a user

Add a database user with:

- USERNAME: admin
- PASSWORD: qwerty123

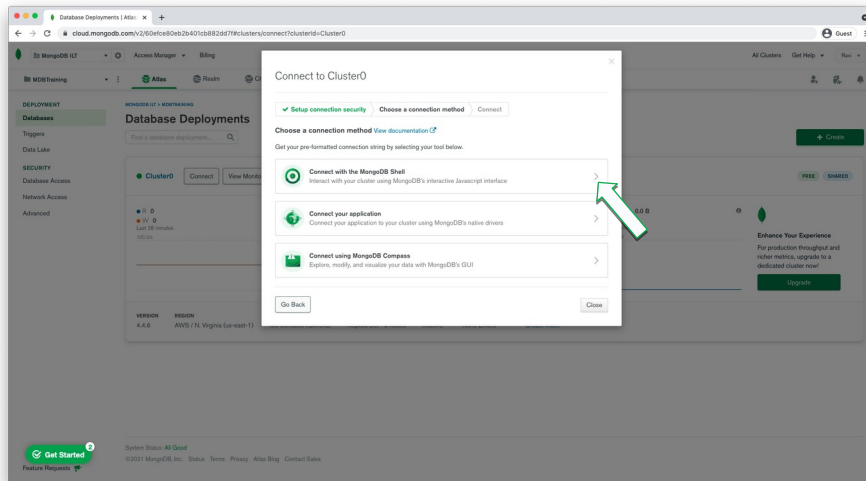

Click **Create Database User** and then click **Choose a connection method** to go to the next step.

Atlas has a lot of default security mechanisms in place:

- We need users created
- We have to use TLS
- Data is on encrypted disks
- We need to add IPs to the Access List

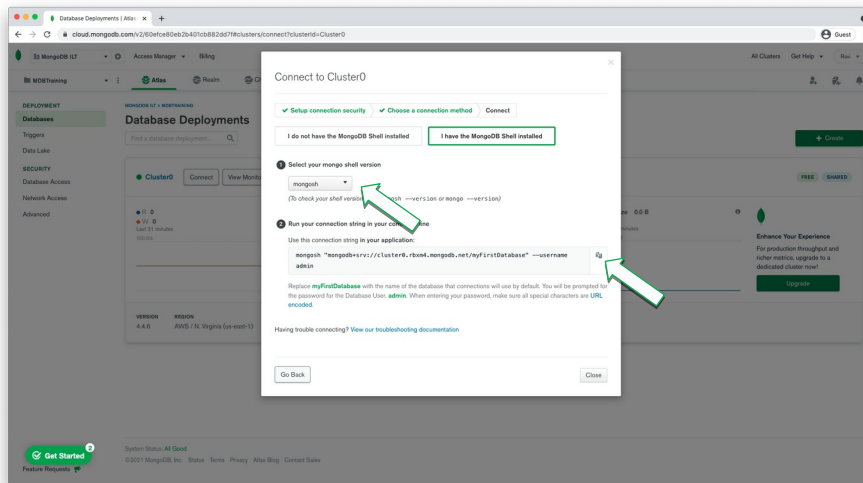

# Connect with mongosh

Now we have the cluster configured; applications can connect. One application is **mongosh** - a javascript REPL (Read Eval Print Loop) we will use to learn some basic MongoDB concepts. Details are also provided for connecting with a GUI tool such as Compass or a programming language driver.

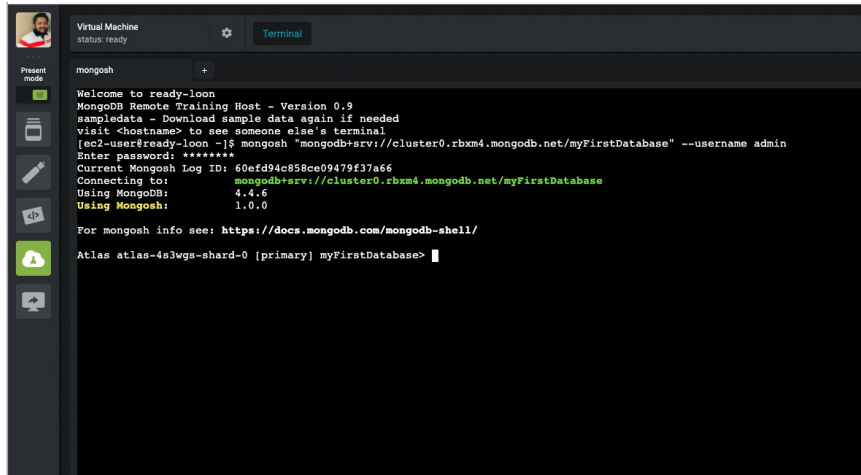

# Connecting to MongoDB Atlas

Now we can run the command shown in Atlas in our terminal.

- This specifies the DNS entry for our cluster (address knows about all the hosts)
- We specify a username and that we will be prompted for a password

# Connect to MongoDB via mongosh

The screenshot shows a Virtual Machine window titled 'Virtual Machine' with a status of 'ready'. The 'Terminal' tab is active, displaying the 'mongosh' command prompt. The terminal output shows the following steps:

```
mongosh
Welcome to ready-loon
MongoDB Remote Training Host - Version 0.9
sampledata - Download sample data again if needed
visit <hostname> to see someone else's terminal
[ec2-user@ready-loon ~]$ mongosh "mongodb+srv://cluster0.rbxm4.mongodb.net/myFirstDatabase" --username admin
Enter password: *****
Current Mongosh Log ID: 60efd94c858ee09479f37a66
Connecting to:      mongodb+srv://cluster0.rbxm4.mongodb.net/myFirstDatabase
Using MongoDB:      4.4.6
Using Mongosh:       1.0.0

For mongosh info see: https://docs.mongodb.com/mongosh-shell/

Atlas atlas-4s3wgs-shard-0 [primary] myFirstDatabase>
```

Paste the command in your terminal and execute the same. Now we are connected to MongoDB.

# What we did so far

---

- We created a free, three-node shared Cluster in MongoDB Atlas
- This is MongoDB, running on servers in AWS managed by MongoDB
- We opened the network to allow our host to connect
- We created an admin user
- We securely logged in to MongoDB via mongosh

# Useful MongoDB Commands

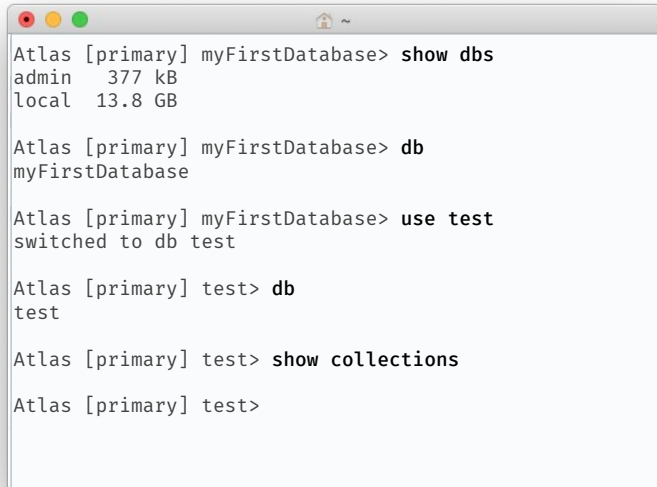

Show all databases in the cluster

Check the current database

Set db to the **test** database

Check the current database again

Show the collections

```
Atlas [primary] myFirstDatabase> show dbs
admin   377 kB
local  13.8 GB

Atlas [primary] myFirstDatabase> db
myFirstDatabase

Atlas [primary] myFirstDatabase> use test
switched to db test

Atlas [primary] test> db
test

Atlas [primary] test> show collections

Atlas [primary] test>
```

**show dbs** is a helper - it's equivalent to a small piece of javascript code to list the databases.

Some commands:

- **db** - this is a database object and is used at the beginning of most commands to run against a DB. Executing just db without any other methods, gives you the current database name.
- **show dbs** - shows available databases
- **use <database>** - selects database to use. Note that it does not need to already exist
- **show collections** - show collections available in the currently selected database. If there are no collections in a database, the command gives an empty response.

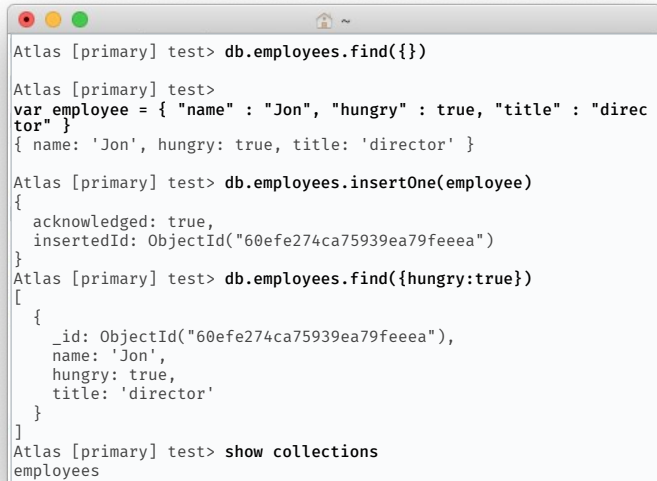

# Interacting with the database

Find all documents in the **employees** collection

Create a **document** as a variable

Insert the **document** in employees collection

Find all **documents** where **hungry** is equal to **true** in employees collection

```
Atlas [primary] test> db.employees.find({})
Atlas [primary] test>
var employee = { "name" : "Jon", "hungry" : true, "title" : "director" }
{ name: 'Jon', hungry: true, title: 'director' }
Atlas [primary] test> db.employees.insertOne(employee)
{
  acknowledged: true,
  insertedId: ObjectId("60efe274ca75939ea79feeea")
}
Atlas [primary] test> db.employees.find({hungry:true})
[
  {
    _id: ObjectId("60efe274ca75939ea79feeea"),
    name: 'Jon',
    hungry: true,
    title: 'director'
  }
]
Atlas [primary] test> show collections
employees
```

Technically you are creating an object - and putting it in MongoDB as a Document, but Record is a generic term.

Some commands:

- **db** - this is a database object and is used at the beginning of most commands to run against a db
- **insertOne()** - this allows us to insert an object e.g.  
`db.getCollection('test').insertOne({name:"bob"})`
- **find()** - this allows us to query e.g. `db.getCollection('test').find()`

**Note:** We don't have to explicitly create a collection, just executing the insert command would create a collection if the collection doesn't exist. As you can see that the show collections command here returns employees collection.

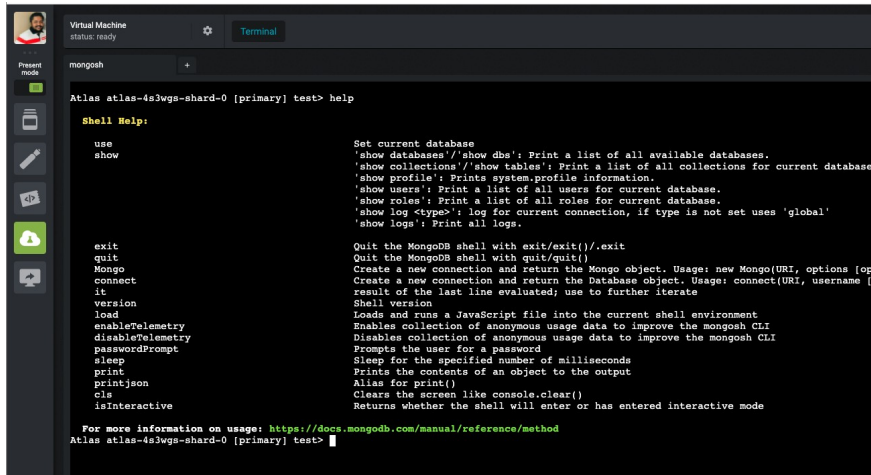

# mongosh - A JavaScript REPL

```
Atlas [primary] test> for(let i=0; i<10; i++) {  
    print(i);  
}  
0  
1  
2  
3  
4  
5  
6  
7  
8  
9  
Atlas [primary] test>
```

We can run JavaScript code snippets in mongosh. It is a JavaScript REPL which is capable of running ES6 as well.

# The Shell has help

```
Virtual Machine
status: ready
Terminal

mongosh

Atlas atlas-4a3wgs-shard-0 [primary] test> help

Shell Help:

use          Set current database
show         'show databases'/'show dbs': Print a list of all available databases.
             'show collections'/'show tables': Print a list of all collections for current database
             'show profile': Prints system.profile information.
             'show users': Print a list of all users for current database.
             'show roles': Print a list of all roles for current database.
             'show log <type>': log for current connection, if type is not set uses 'global'
             'show logs': Print all logs.

exit         Quit the MongoDB shell with exit/exit()/exit
quit         Quit the MongoDB shell with quit/quit()
Mongo        Create a new connection and return the Mongo object. Usage: new Mongo(URI, options [op
connect      Create a new connection and return the Database object. Usage: connect(URI, username [
it           result of the last line evaluated; use to further iterate
version      Shell version
load         Loads and runs a JavaScript file into the current shell environment
enableTelemetry Enables collection of anonymous usage data to improve the mongosh CLI
disableTelemetry Disables collection of anonymous usage data to improve the mongosh CLI
passwordPrompt Prompts the user for a password
sleep        Sleep for the specified number of milliseconds
print        Prints the contents of an object to the output
printjson    Alias for print()
cls          Clears the screen like console.clear()
isInteractive Returns whether the shell will enter or has entered interactive mode

For more information on usage: https://docs.mongodb.com/manual/reference/method
Atlas atlas-4a3wgs-shard-0 [primary] test>
```

We can type just `help` in the shell to see all available help functions.

Most objects as well expose a `help()` method that we can call on them like `db.help()`.

# Recap

---

- MongoDB Atlas is MongoDB hosted as a service.
- MongoDB Atlas is very flexible and includes small, free clusters.
- MongoDB Atlas always uses TLS and Authentication and a Firewall.
- For all exercises, it is important to work as a group.
- You can log in to Atlas via mongosh.
- There is mongosh installed on your training instance.

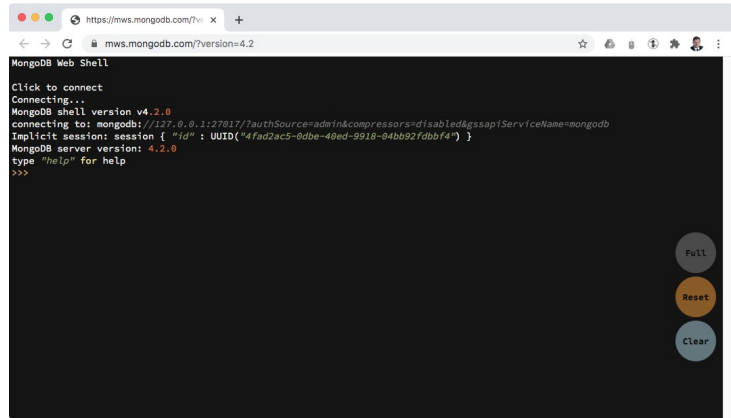

## Appendix

Only relevant for repeating these exercise after the course  
if you wish to.

# The MongoDB Web Shell

- Hosted in a Browser
- Auto-connects to shared cluster
- Can connect to your cluster

<https://mws.mongodb.com>

You **can access** a shell from a browser too - this connects by default to a private Atlas example so you can play - like a sandbox. You can connect it to your own cluster by replacing the following value with your own

- `db = new`  
`Mongo("mongodb+srv://admin:<password>@cluster0.bku7p.mongodb.net/myFirstDatabase?retryWrites=true&w=majority").getDB("admin")`
- `Db = db.getSiblingDB("test")`

# The Old MongoDB Shell

There is an older MongoDB shell that works in a similar way as the new mongosh.

If mongosh is not available, you can use the old MongoDB shell as well.

Major difference we note is that the old shell doesn't have syntax highlighting.

```
[ec2-user@ready-loon ~]$ mongo "mongodb+srv://cluster0.rbxm4.mongodb.net/myFirstDatabase" --username admin
MongoDB shell version v4.4.6
Enter password:
connecting to: mongodb://cluster0-shard-00-00.rbxm4.mongodb.net:27017,cluster0-shard-00-01.rbxm4.mongodb.net:27017,cluster0-shard-00-02.rbxm4.mongodb.net:27017/?ssl=true&replicaSet=atlas-4s3wgs-shard-06&ssl=true&authSource=admin&retryWrites=true&retryReads=true&serverSelectionTimeoutMS=30000&socketTimeoutMS=30000&connectTimeoutMS=30000&compressors=disabled&gssapiServiceName=mongodb&replicaSet=atlas-4s3wgs-shard-06&ssl=true
Implicit session: session { "id" : UUID("043a9053-81d8-4658-b6c5-210411a272c5") }
MongoDB server version: 4.4.6
Welcome to the MongoDB shell.
